

Merge Query

Steps in Power Query

1. Open **Transform Data**.
2. Select your **Sales** table.
3. Go to **Home → Merge Queries**.
4. Select the second table (**Customer**).
5. Click the matching column in both tables:
 - Order[CustomerNumber]
 - Customers[CustomerNumber]
6. Choose the **Join Kind**:
7. **Full Outer Join** → when you want to keep **all rows from both tables**, including rows that don't have a match.
8. A new column containing **Table** values will appear.
9. Click the **expand icon (↔)** on that column.
10. Select CustomerNumber.
11. Uncheck **Use original column name as prefix** if you don't want Order. CustomerNumber.
12. Click **OK**.

The screenshot shows the Power Query 'Merge' dialog box. The 'orders' table is selected as the first table, and the 'customers' table is selected as the second table. The 'requiredDate' column from 'orders' and the 'customerNumber' column from 'customers' are selected for matching. The 'Join Kind' is set to 'Full Outer (all rows from both)'. The 'Fuzzy matching options' are unchecked. The dialog box shows a preview of the merged data, including columns for 'orderDate', 'requiredDate', 'shippedDate', 'status', 'customerNumber', 'shippedDays', and 'Shipping Quality'. The 'Query Settings' pane on the right shows the 'Name' as 'orders' and the 'Applied Steps' as 'Source', 'Navigation', 'Imported CSV', 'Promoted Headers', 'Changed Type', 'Replaced Value', 'Removed Columns', 'Changed Type1', 'Added Custom', 'Changed Type2', 'Added Conditional Column', 'Replaced Value1', and 'Removed Errors'.
